

What is Claimed Is:

1. A head positioning control method for a disk device
for positioning a head to a predetermined position of a disk,
5 comprising:

a step of demodulating a position signal of said disk read
by said head;

a step of calculating the demodulation position according
to said demodulation result; and

10 a step of calculating control quality according to the
position errors between said demodulation position and a target
position and controlling an actuator which drives said head;

wherein said calculation step comprises a step of correcting
said demodulation result with a correction value which depends
15 on a moving speed of said head and obtaining the demodulation
position.

2. The head positioning control method according to Claim
1, wherein said demodulation step comprises:

20 a step of demodulating a first position information and
a second position information, which have different phases from
each other, from said position signal; and

said calculation step comprises:

a step of comparing said first position information and
25 said second position information;

a step of correcting said first position information with
a first correction value, which depends on the moving speed of

said head, according to said comparison result; and

a step of correcting said second position information with a second correction value, which depends on the moving speed of said head, according to said comparison result.

5

3. The head positioning control method according to Claim 1,

wherein said demodulation step further comprises:

10 a step of demodulating a track number and offset information from said position signal; and

said calculation step comprises:

a step of selecting said track number as said demodulation position when the moving speed of said head is faster than a predetermined speed; and

15 a step of calculating a demodulation position by correcting said offset information with a correction value which depends on the moving speed of said head when the moving speed of said head is slower than a predetermined speed.

20

4. The head positioning control method according to Claim 1,

wherein said demodulation step comprises:

a step of demodulating a track number and offset information from said position signal; and

25 said calculation step comprises:

a step of correcting said offset information with a correction value where gain, which depends on the recording

position of said offset information, is added to the moving speed of said head with the recording position of said track number as a reference.

5 5. The head positioning control method according to Claim 1,

 wherein said demodulation step comprises:

 a step of demodulating a position signal of a magnetic disk read by a magnetic head.

10 6. A head positioning control device for a disk device for positioning a head to a predetermined position of a disk by driving an actuator, comprising:

 a demodulation circuit which demodulates a position signal
15 of said disk read by said head; and

 a control circuit which calculates a demodulation position according to said demodulation result and controls the actuator for driving said head by calculating control quantity according to the position errors between said demodulation position and
20 the target position;

 wherein said control circuit corrects said demodulation result with a correction value which depends on the moving speed of said head and calculates said demodulation position.

25 7. The head positioning control device according to Claim 6, wherein said demodulation circuit demodulates a first position information and a second position information, which have

different phases from each other, from said position signal;
and

said control circuit compares said first position
information and said second position information, corrects said
5 first position information with a first correction value, which
depends on the moving speed of said head, according to said
comparison result, and corrects said second position information
with a second correction value, which depends on the moving speed
of said head, according to said comparison result.

10 8. The head positioning control device according to Claim
6,

wherein said demodulation circuit demodulates a track
number and offset information from said position signal; and

15 said control circuit selects said track number as said
demodulation position when the moving speed of said head is faster
than a predetermined speed, and calculates a demodulation
position by correcting said offset information with a correction
value which depends on the moving speed of said head when the
20 moving speed of said head is slower than a predetermined speed.

9. The head positioning control device according to Claim
6,

25 wherein said demodulation circuit demodulates a track
number and offset information from said position signal; and

said control circuit corrects said offset information with
a correction value where gain, which depends on the recording

position of said offset information, is added to the moving speed of said head with the recording position of said track number as a reference.

5 10. The head positioning control device according to Claim 6,

 wherein said demodulation circuit demodulates a position signal of a magnetic disk read by a magnetic head.

10 11. A disk device comprising;
 a head for at least reading a disk;
 an actuator for positioning said head to a predetermined position of said disk:

 a demodulation circuit which demodulates a position signal
15 of said disk read by said head; and

 a control circuit which calculates a demodulation position according to said demodulation result and controls the actuator for driving said head by calculating control quantity according to the position errors between said demodulation position and
20 the target position;

 wherein said control circuit corrects said demodulation result with a correction value which depends on the moving speed of said head and calculates said demodulation position.

25 12. The disk device according to Claim 11, wherein said demodulation circuit demodulates a first position information and a second position information, which have different phases

from each other, from said position signal; and

said control circuit compares said first position information and said second position information, corrects said first position information with a first correction value, which depends on the moving speed of said head, according to said comparison result, and corrects said second position information with a second correction value, which depends on the moving speed of said head, according to said comparison result.

13. The disk device according to Claim 11,

wherein said demodulation circuit demodulates a track number and offset information from said position signal; and

said control circuit selects said track number as said demodulation position when the moving speed of said head is faster than a predetermined speed, and calculates a demodulation position by correcting said offset information with a correction value which depends on the moving speed of said head when the moving speed of said head is slower than a predetermined speed.

14. The disk device according to Claim 11,

wherein said demodulation circuit demodulates a track number and offset information from said position signal; and

said control circuit corrects said offset information with a correction value where gain, which depends on the recording position of said offset information, is added to the moving speed of said head with the recording position of said track number as a reference.

15. The disk device according to Claim 11,
wherein said demodulation circuit demodulates a position
signal of a magnetic disk read by a magnetic head.
